

Road Hazard Condition Monitoring System

Objective

We aim to perform maintenance and degradation prediction considering the current road situation by utilizing mass-produced vehicles to constantly monitor the road conditions. That will enable road management with lower costs and greater timeliness.

Technical Content

Detects and recognizes the road situation by utilizing mass-produced vehicle data: pothole detection, road surface degradation estimation and degradation prediction

Driving information

- Location information
- Vehicle speed

Moving information

- Left and right G
- Steering operation

Some of the vehicle conditions

- Turn signal, etc.

Estimates the road surface conditions utilizing G sensors and other technologies

Technical features

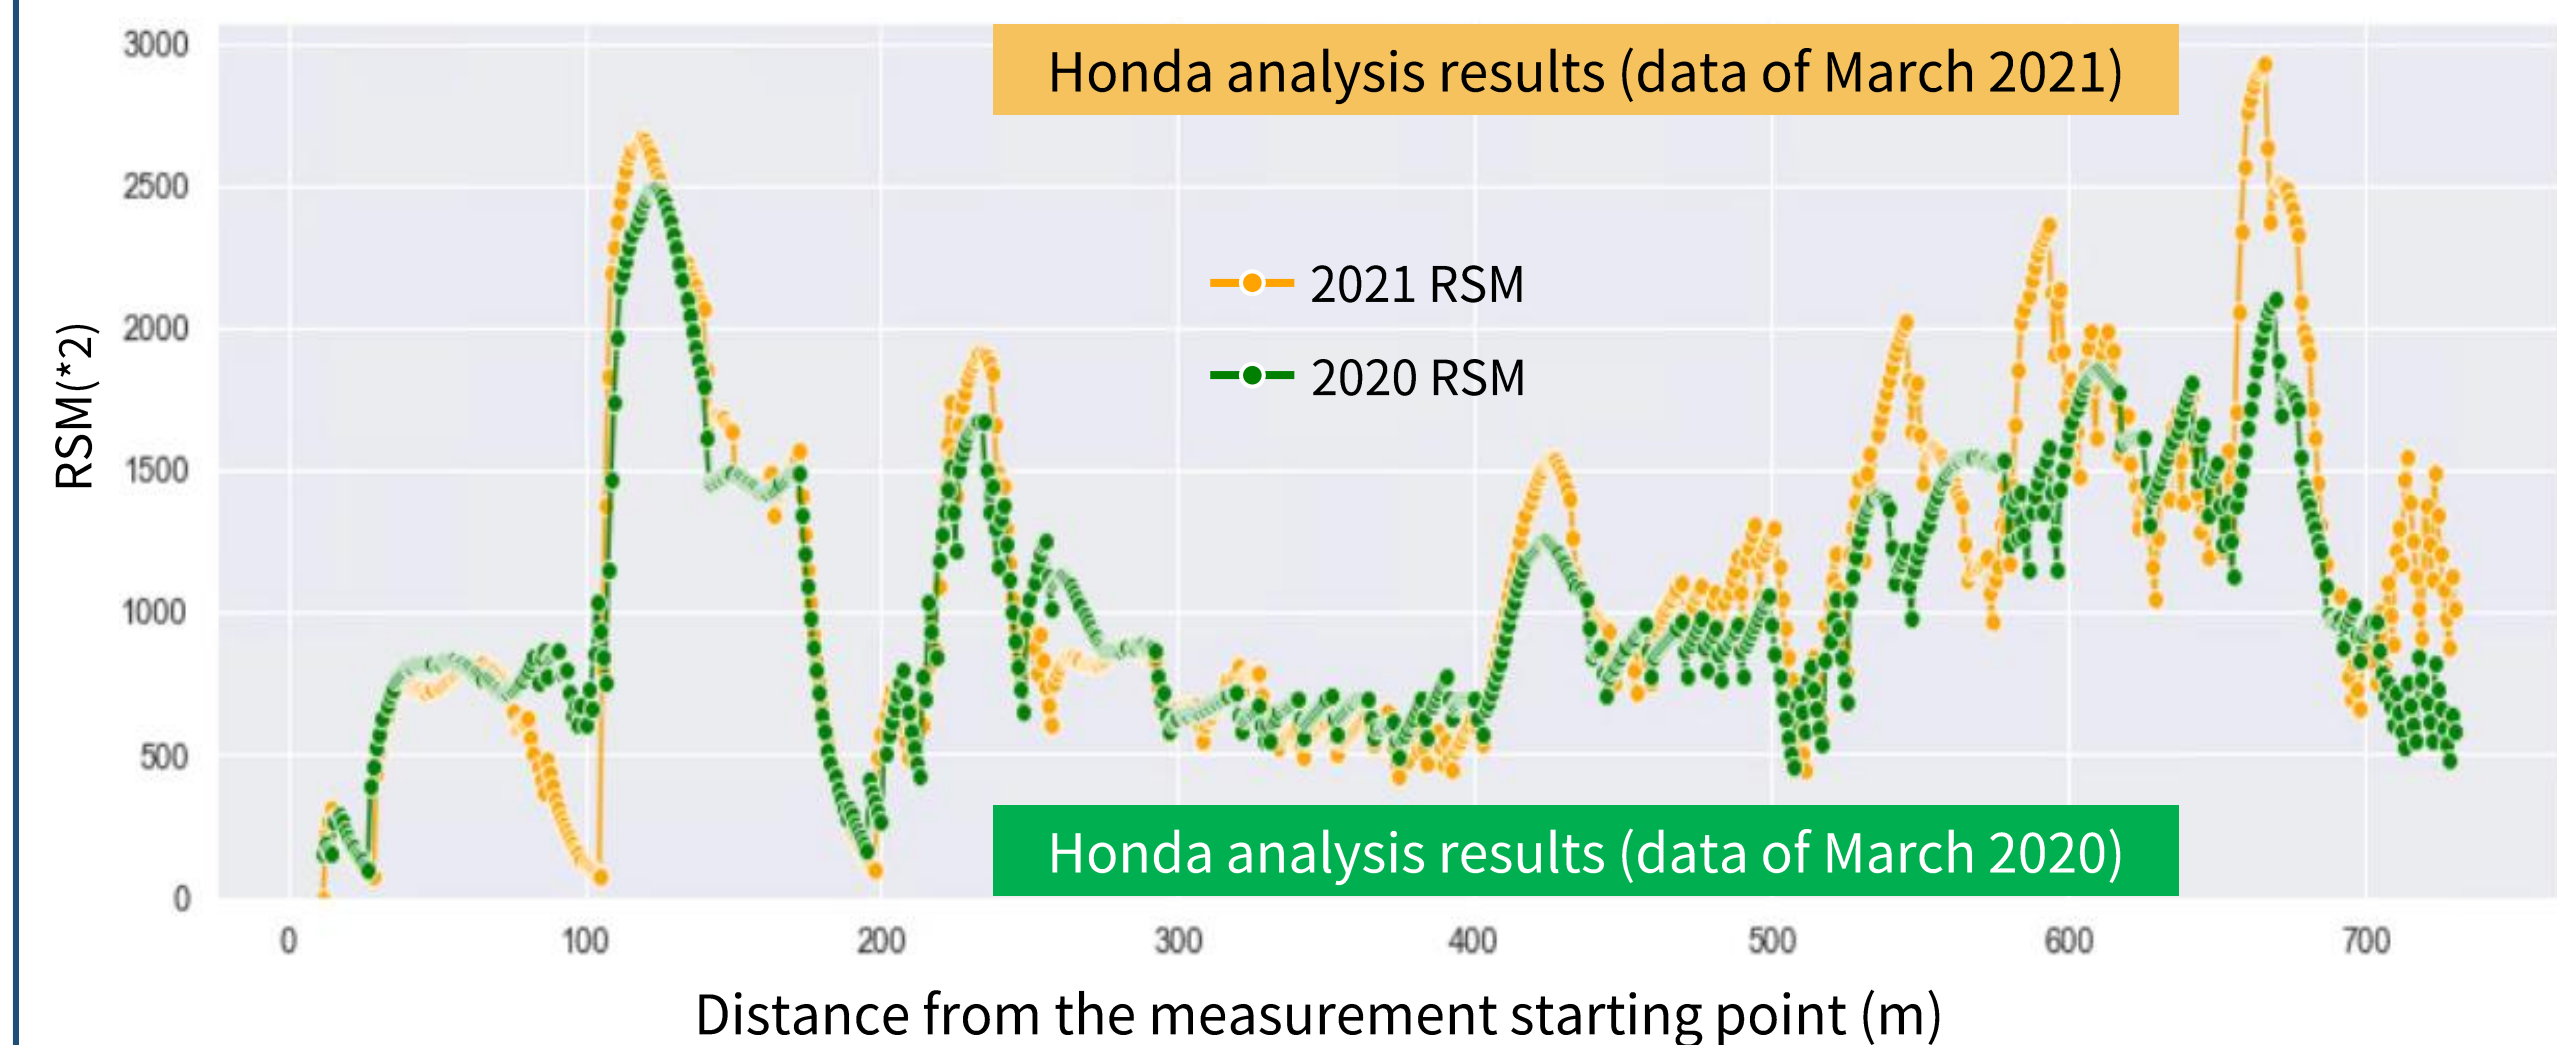

The system is strongly related to the IRI^{*1} international standard index for road management. The technology provides constant monitoring, so the following forms of analysis are possible.

- It is possible to detect potholes in real-time.
- It is possible to analyze degradation over time with high precision.

*1: International Roughness Index

Example of the Analysis of Degradation over Time Through a Comparison with Past Data

It is possible to visualize the state of progress of degradation over one year by comparing data of 2020 and 2021.

*2: RSM value – Honda's own evaluation value
Value of the road surface data related to the flatness of the road calculated using the data from the on-board sensors

In collaboration with the Japan Ministry of Internal Affairs and Communications
